

URL SHORTENER APPLICATION

A **URL Shortener** is a web application that converts a long URL (Uniform Resource Locator) into a shorter and more manageable link. This helps users share links easily without copying long web addresses.

URL shorteners work by creating a **redirect** from the short URL to the original long URL. When the short URL is opened in a browser, the user is redirected automatically to the original website.

The project consists of 2 parts:

1. Frontend (done with HTML, CSS and Bootstrap)
2. Backend - Flask (Python)
3. ORM - SQLAlchemy
4. Database - SQLite

Front-End Information

The front-end consists of 2 web pages:

1. Home Page - A page will be shown where the user can enter the URL, he/she wants to shorten. After the 'shorten' button is clicked, the shortened URL is displayed in the text-field which the user can copy using the copy button.
2. History Page - Containing all the Original URLs along with the Shortened URLs.

Project Workflow

1. Users can enter the URL they want to shorten. After entering a URL, click on the 'Shorten' URL button to display the shortened URL in the following text-field which can be copied by clicking on the copy button.

2. After the 'Shorten' button is clicked, the URL that is entered is saved in our database with the shortened URL. It is saved in the database so that the user can look into the previous URLs he entered in our web-app with their shortened URL.
3. Try to verify the URL entered by the user is correct or not.

This project successfully implements a URL Shortener Web Application using Flask and SQLAlchemy. It allows users to shorten URLs, copy them easily, and store them for future use in the History page. The application is simple, responsive, and useful for everyday link sharing.
